STI/HIV TESTING TOOL
Easy as 1-2-3

STEP 1
Starting a conversation about sexual health testing

Offering routine STI/HIV testing helps patients feel more comfortable and willing to discuss their sexual health.

Examples of how routine STI/HIV testing can be offered:

Young people (15–29 years):

“STIs are very common among young people and they may not even know they have an STI. We encourage all sexually active young people to get tested regularly for STIs. Would you like a sexual health check-up today?”

Reproductive health consultations:

“While you’re here for advice about contraception/cervical screening it’s a good time to talk about other areas of sexual health, like having a sexual health check-up…”

Travel consultations:

“Some people take risks when they travel overseas and that includes having unprotected sex. If you like, we could do a sexual health check-up before you go and when you return.”

Hepatitis B vaccination:

“Have you had a hepatitis B vaccination? It protects against an infection that can be sexually transmitted. Do you want to talk about this today?”

Risk assessment (sexual history)

Ask these questions in the following order to identify potential risks and which tests to perform:

“I’d like to ask you some questions about your sexual activity so we can decide what tests to do:”

- When did you last have sex?
- Was that with a regular or casual partner?
- Was it with a man, a woman, or both?
- Did you use condoms?
- When you had sex, was it vaginal, oral or anal sex?
- When did you last have sex with a different person?
- Did you use condoms with them?

Go to www.testingportal.ashm.org.au to assess hepatitis B and C risk.

Note: STI/HIV testing requires only ‘informed consent’.

In NSW HIV ‘pre-test counselling’ is no longer required.

### Recommendations from the Australian STI Management Guidelines (unless otherwise stated)

# Infection Specimen Collection Site & Test Type

## Females

### Chlamydia
- Vaginal swab* OR
  - First pass urine (at any time of the day)* OR
  - Endocervical swab**
    - *Self-collected*  **Clinician-collected**
- Chlamydia NAAT (PCR)

### Gonorrhoea
- Vaginal swab* OR
  - First pass urine (at any time of the day)* OR
  - Endocervical swab**
    - *Self-collected*  **Clinician-collected**
- Throat swab (for female sex workers ONLY)**
  - *Self-collected*  **Clinician-collected**
- Gonorrhoea NAAT (PCR)

### Trichomoniasis
- Vaginal swab* OR
  - First pass urine (at any time of the day)*
    - *Self-collected*
- Trichomonas NAAT (PCR)

## Males

### Chlamydia
- First pass urine (at any time of the day)*
  - AND THE FOLLOWING FOR MSM:
    - Throat swab (for MSM)**
    - Rectal swab (for MSM)***
      - *Self-collected*  **Clinician-collected  ***Self-collected or Clinician-collected**
- Chlamydia NAAT (PCR)

### Gonorrhoea
- First pass urine (at any time of the day)*
  - Throat swab (for MSM)**
    - *Clinician-collected**
  - Rectal swab (for MSM)***
    - **Clinician-collected***
- Gonorrhoea NAAT (PCR)

## Females and Males

### Syphilis
- Blood
  - Syphilis serology

### HIV
- Blood
  - HIV Ab/Ag

### Hepatitis A
- Blood
  - Anti-HAV Ig-total

### Hepatitis B
- Blood
  - HBsAg
  - Anti-HBe
  - Anti-HBs

### Hepatitis C
- Blood
  - HCV Ab

## Contact Tracing

### How Far Back to Contact Trace:

<table>
<thead>
<tr>
<th>Infection</th>
<th>How Far Back to Trace</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chlamydia</td>
<td>6 months</td>
</tr>
<tr>
<td>Gonorrhea</td>
<td>2 months</td>
</tr>
</tbody>
</table>
| Syphilis    | Primary syphilis – 3 months plus duration of symptoms  
Secondary syphilis – 6 months plus duration of symptoms  
Early latent syphilis – 12 months |
| HIV         | Start with recent sexual or injecting drug use needle-sharing partners  
Outer limit is onset of risk behaviour or last known HIV-negative test result  
For newly acquired cases contact your local Public Health Unit (PHU) and/or specialist |
| Hepatitis B | 6 months prior to onset of acute symptoms  
If asymptomatic, according to risk history  
For newly acquired cases contact your local PHU and/or specialist |
| Hepatitis C | 6 months prior to onset of acute symptoms  
If asymptomatic, according to risk history  
For newly acquired cases contact your local PHU and/or specialist  
Note: rarely sexually transmitted except in HIV co-infection |
| Trichomoniasis | Unknown; important to treat current partner |
STEP 3 continued…

Why contact trace?
Contact tracing is conducted to prevent your patient from becoming reinfected and to reduce onward transmission of STIs/HIV.

Whose responsibility is it to contact trace?
It is the responsibility of the diagnosing doctor to initiate and document a discussion about contact tracing.

How to contact trace:

a) Introduce the reasons for contact tracing

“It’s important your partner(s) get treated so you don’t get infected again.”

b) Help identify which partner(s) need to be informed

Use cues such as location or events; use a non-judgemental approach; some people have more than one sexual partner who may require treatment.

“Think back to when and where you had sex recently or any special events.”

c) Explain contact tracing methods and offer choice

Clinician-initiated contact tracing:
- Means the diagnosing doctor, practice delegate or external service informs the contact(s) with the index patient’s consent
- Contact tracing can be performed anonymously or not (depending on the wishes of the patient)
- Anonymous contact tracing is the best option for HIV or when there are domestic violence concerns

AND

Patient-initiated contact tracing:
- Means your patient chooses to inform their own contact(s)
- Discuss with the patient how their contact(s) can be informed

d) Support your patient to notify their partner(s)

Provide STI fact sheets, offer contact tracing websites and schedule a follow-up visit/phone call. Assistance could be provided to your patient to access contact tracing websites during the consult.

www.letthemknow.org.au
Information on STIs and advice for all patients. Online anonymous notification of contacts via SMS, email or letter.

www.thedramadownunder.info
Information on STIs and advice for MSM. Online anonymous notification of contacts via SMS or email.

www.bettertoknow.org.au
Information on STIs and advice for Aboriginal and/or Torres Strait Islander people. Online anonymous notification of contacts via SMS or email.

www.rypl.positivelife.org.au
Mobile app for patients including STI information, partner notification advice and tools

www.endinghiv.org.au/sti/let-them-know
Information on STIs and advice for MSM. Online anonymous notification of partners via SMS or email.

For chlamydia, consider use of patient-delivered partner therapy (PDPT) where it is unlikely partners will access testing/treatment.

e) Document discussions in patient medical record

For more help to contact trace?

Australasian Contact Tracing Guidelines
NSW Sexual Health Infolink: 1800 451 624
Outside NSW contact your local sexual health clinic or specialist support service.

PDPT is the practice of providing a prescription or medication to a patient diagnosed with chlamydia to give to their partner without that partner being assessed by the health care provider. More info: Australasian Contact Tracing Guidelines and contact your local Health Department for regulations in your state.

Post-exposure Prophylaxis (PEP): should be considered for recent contacts of HIV and HBV within 72 hours of exposure. In NSW contact your local sexual health clinic or the NSW PEP Hotline 1800 737 669 for advice. Outside NSW www.getpep.info.

HIV PreExposure Prophylaxis (PrEP): is an HIV treatment medicine that can be given to HIV-negative people to prevent an infection before someone is actually exposed. More info: ASHM and Decision Making in PrEP: Prescribing Pathway for PrEP in NSW
